Simple Linear Regression

Friday, April 1, 2022   11:16 PM

Training the Simple Linear Regression model on the Training set

```python
from sklearn.linear_model import LinearRegression # we import LinearRegression be
cause we are using Simple regression model to train the dataset
regressor = LinearRegression()
regressor.fit(X_train, y_train)
```

Predicting the Test set results

```python
pred = regressor.predict(X_test)
#We are predicting the Salary of y_train and we will compare with y_test to compa
re the accuracy of the model
```
